

## *Growth Control In Woody Plants*

### **Growth Control In Woody Plants**

Plants are mainly multicellular, predominantly photosynthetic eukaryotes of the kingdom Plantae. Historically, plants were treated as one of two kingdoms including all living things that were not animals, and all algae and fungi were treated as plants. However, all current definitions of Plantae exclude the fungi and some algae, as well as the prokaryotes (the archaea and bacteria).

Plant hormones (also known as phytohormones) are signal molecules produced within plants, that occur in extremely low concentrations. Plant hormones control all aspects of growth and development, from embryogenesis, the regulation of organ size, pathogen defense, stress tolerance and through to reproductive development. Unlike in animals (in which hormone production is restricted to specialized ...

Read the complete article on No-Technique Plant Training. Supercropping – this technique is a more “extreme” kind of bending, and is used for stems that are too tall but have become woody and difficult to bend. With supercropping you “soften up” the stem first before bending it at an extreme angle. Supercropping can be incredibly helpful towards wrangling an out-of-control plant, and ...

Periderm: When plants increase in girth due to secondary growth, they slough off their epidermal tissues and replace them with periderm. The periderm is composed of cork cells (phellem) that have thick walls impregnated with suberin (a waxy substance which protects and waterproofs the surface of the cells).

Shearing. This is the type of pruning you should use least often. It essentially involves removing the outer layer of foliage, so that the foliage grows back denser. While appropriate for certain plants, many respond negatively to this treatment, especially if used as a long term strategy to keep a shrub small.
