Probability Three Different Concepts of Probability. The classical interpretation of probability is a theoretical probability based on the physics of the experiment, but does not require the experiment to be performed. For example, we know that the probability of a balanced coin turning up heads is equal to 0.5 without ever performing trials of the experiment.

Formula:  $n$  = number of trials  $k$  = number of successes  $n - k$  = number of failures  $p$  = probability of success in one trial  $q = 1 - p$  = probability of failure in one trial. Example: You are taking a 10 question multiple choice test. If each question has four choices and you guess on each question, what is the probability of getting exactly 7 questions correct?

The Binomial probability formula is given by  $nC r p^r q^{n-r}$  where  $p$  represents the probability of success and  $q$  represents the probability of failure. Example : - Probability that a batsman scores a century in a cricket match is  $1/3$ . Find the probability that out of 4 matches, he may score century

The weighted arithmetic mean is similar to an ordinary arithmetic mean (the most common type of average), except that instead of each of the data points contributing equally to the final average, some data points contribute more than others. The notion of weighted mean plays a role in descriptive statistics and also occurs in a more general form in several other areas of mathematics.

Figure 1 is a discrete probability distribution: It shows the probability for each of the values on the X-

axis. Defining a head as a "success," Figure 1 shows the probability of 0, 1, and 2 successes for two trials (flips) for an event that has a probability of 0.5 of being a success on each trial.

5. Securities trading: The probability of a loss or drop in value. Trading risk is divided into two general categories: (1) Systemic risk affects all securities in the same class and is linked to the overall capital-market system and therefore cannot be eliminated by diversification. Also called market risk. (2) Nonsystematic risk is any risk that isn't market-related or is not systemic.
