In statistics, a categorical variable is a variable that can take on one of a limited, and usually fixed number of possible values, assigning each individual or other unit of observation to a particular group or nominal category on the basis of some qualitative property. In computer science and some branches of mathematics, categorical variables are referred to as enumerations or enumerated types.

In statistics, the concept of the shape of a probability distribution arises in questions of finding an appropriate distribution to use to model the statistical properties of a population, given a sample from that population. The shape of a distribution may be considered either descriptively, using terms such as "J-shaped", or numerically, using quantitative measures such as skewness and kurtosis.

Public policy documents on gender and health mostly rely on categorical understandings of gender that are now inadequate. Poststructuralist thought is an advance, but relational theories of gender, treating gender as a multidimensional structure operating in a complex network of institutions, provide the most promising approach to gendered embodiment and its connection with health issues.
